

Teacher Time Back Lab facilitator playbook

Leadership setup, 90-minute teacher lab, technology fallback, nuanced FAQ, and follow-up.

CORE PROMISE

Bring one task you keep doing. Leave with one assistant you can use again.

HUMAN LINE

The assistant prepares. The teacher decides.

Before outreach

- ☐ Sales page and flagship demo are current
- ☐ Pilot overview is attached, not the full curriculum
- ☐ Leadership setup happens before the lab
- ☐ No guaranteed time-saving, compliance, or licensure claim
- ☐ Andrew receives no passwords or student data

Leadership setup | 45 minutes

Time	Purpose	Say and do
0–5	Frame the decision	Name one exact product, one staff account type, and one school contact.
5–15	Name the tool and account	Confirm login path, account controls, and cohort access.
15–25	Set the boundary	No real student information or work. Confirm local rules and escalation.
25–35	Confirm operations	Cohort, space, devices, accessibility, technology support, and non-evaluative participation.
35–42	Preview the product	Show the Weekly Lesson Setup Assistant cycle.
42–45	Lock next actions	Complete the Platform Setup Record.

Opening script | first 10 minutes

Welcome: Today is not a tour of AI. You are going to stop rebuilding one piece of work. I will show you a finished example first, then we will build your version together. You do not need coding or previous AI experience.

Boundary: We will not use real student information, student work, family records, personnel records, or confidential school files. If you are unsure, stop and ask the school contact.

Proof: Show rough notes, saved instructions, first result, and teacher correction before explaining the fields.

Responsibility: The assistant prepares. The teacher decides.

Teacher lab | 90 minutes

Time	Participant action	Proof before moving on
0–10	See the finished product	Visible completion
10–22	Choose one repeated task	Visible completion
22–32	Check the school tool and account	Visible completion
32–52	Build the five fields	Visible completion
52–68	Practice and review	Visible completion
68–78	Revise once and retest	Visible completion
78–86	Save and begin the two-week log	Visible completion
86–90	Exit check and next step	Visible completion

Step prompts and checks

Choose one repeated task

Say: What do you rebuild often enough to resent, but can still review before using?

Check: One bounded drafting or organizing job.

Check the tool and account

Say: Read the product and account from the school record. If yours does not match, stop and ask.

Check: Correct account.

Build the five fields

Say: Write one sentence for each field. Specific beats clever.

Check: Five fields and source boundary.

Practice

Say: Use the provided practice pack first.

Check: One practice result.

Review

Say: Find one thing you would change.

Check: One teacher correction.

Save and measure

Say: Name it for next week. Count correction and review time.

Check: Saved setup and understood log.

Safety rehearsal | four questions

Say: This is a four-question practice. Choose one answer. When the safe answer is selected, the visual changes and explains why.

1. Which account should a teacher use?

Correct: The exact AI tool and staff account the school named. A personal or workaround account is not the lab path.

2. Is replacing names with Student A or a key ID automatically safe?

Correct: No. Other details, group size, context, and linked records may still identify a student.

3. What should happen when required information is missing?

Correct: The assistant marks NEEDS TEACHER INPUT. It does not guess or invent the missing detail.

4. Who makes the final decision?

Correct: The teacher. The assistant prepares. The teacher reviews, corrects, and decides.

Technology fallback

Continue from exported images and complete the five fields on paper. The school host handles access. Do not create workaround accounts. Schedule completion because the product is not finished until saved and tested.

Two-week follow-up | 30 minutes

Time	Move	Language
0–5	Restate the decision	Decide whether each workflow should be kept, revised, or stopped.
5–15	Review the evidence	Uses, before time, assisted time, correction and review time, and result quality.
15–23	Troubleshoot patterns	Discuss broad tasks, missing inputs, weak output shape, and review burden without exposing participant content.
23–28	Make decisions	Each teacher chooses keep, revise, or stop.
28–30	Close	Leadership receives only cohort-level learning.

Nuanced FAQ | student information and instructional boundaries

Can a teacher review specific student work if names are removed?

Not in the introductory lab. Names are only one kind of identifier. Initials, key IDs, small groups, dates, needs, quotations, and surrounding context may still identify a student. A later engagement requires school review of the platform, purpose, fields, access, retention, reporting, and specialist responsibilities before student work is used.

Can teachers track groups or learning trends?

Not in this introductory lab. A later workflow may be possible only after the school defines the educational purpose, minimum necessary data, access, retention, reporting, and decision ownership. Small groups can create re-identification risk. Andrew can facilitate workflow design, but school privacy, legal, security, special-education, and instructional leaders make the applicable decisions.

What if a separate key maps coded IDs back to students?

A separate key can reduce casual exposure, but it does not automatically de-identify data. If someone can reasonably reconnect the code to a student, or surrounding details identify the student, treat it as identifiable. This requires a separate school-reviewed data workflow.

Can the assistant grade, group, place, diagnose, discipline, or recommend accommodations?

No. Those decisions remain with teachers and qualified school personnel. The introductory lab focuses on bounded drafting and organizing work that a teacher reviews.

Can teachers use publisher curriculum or a colleague's materials?

Only when the school and platform permit it. The lab does not assume licensed or third-party materials may be uploaded.

Nuanced FAQ | accounts, platforms, claims, and credentials

What if a teacher has no AI account?

They do not create a workaround or personal account. The school resolves access. A teacher may observe and draft on paper, but has not completed the product until the setup is saved and tested in the permitted account.

Is this only for OpenAI products?

No. The five-part method can be adapted to ChatGPT, Microsoft Copilot, Google Gemini, MagicSchool, or another school-selected product. Interfaces and controls differ, so Andrew prepares and tests one platform setup card for the actual account type before the pilot.

Does the lab guarantee time savings?

No. Teachers measure total time, including correction and review, for two weeks and choose keep, revise, or stop.

Is this compliance or legal training?

No. Andrew teaches a bounded workflow and safety routine. The school and qualified specialists retain policy, legal, privacy, security, procurement, labor, special-education, and other regulated decisions.

What are Andrew's credentials?

Andrew Wolverton is a former Indiana classroom educator, program builder, facilitator, and human-led systems designer. He helps teams turn confusing workflows into practical tools people can understand, review, and use.

Completion check

- ☐ Task is bounded and repeated
- ☐ Tool and account match the school record
- ☐ Five fields and source boundary are complete
- ☐ Practice used no real people or records
- ☐ One result was reviewed and revised
- ☐ Setup is saved
- ☐ Teacher understands the two-week decision

Attendance alone is not completion.
